Abstract (en)

This invention relates to a ventilation grille (1), comprising an air flow passage (2), a setting valve (5) which is at least adjustable to an open and a closed position, a self-adjusting valve (6) which is arranged at a distance from the setting valve (5) so as to be tiltable between an open and a closed position, and a bridging device (7, 10) which is arranged separate from the self-adjusting valve (6) between the valves (5, 6) in such a manner that it forces the self-adjusting valve (6) to its closed position when the setting valve (5) moves to its closed position and leaves the self-adjusting valve (6) unimpeded when the setting valve (5) is set to another position.
