Abstract (en)
[origin: WO2014136084A1] Gun (1) comprising a firearm frame (2) that houses a part of a firing device (4), a slide (8) slidably supported by the frame (2) between a closed configuration of a firing chamber (10) of the firearm (1) and an open configuration of said chamber (10). The firearm further comprises a firing pin (12), at least partially housed in the slide (8), constantly pressed by first elastic means (14) towards a firing position in which one end (16) of said firing pin (12) engages the firing chamber (10), and movable towards an armed position in which it is distanced from the chamber (18), and a safety device (18) against premature firing. Such a device (18) releases the firing pin (12) from the armed position only when the slide (8) is in the closed configuration, and it comprises a blocking member (20) of the firing pin (12), which contrasts the action of the first elastic means (14), and is susceptible to be released by the firing device (4).
