Abstract (en)

Provided are a multi-antenna system and a mobile terminal. A dual band is achieved through PIFA antennas on dielectric substrates and grooves on radiation patches of the antennas. The isolation degree between the antennas is improved by arranging an isolated branch knot between the antennas. The isolation degree between the antennas on the two medium substrates is further improved through the two independent medium substrates and a metal ground. In addition, the PIFA antennas are used, so that the multi-antenna system and the mobile terminal can increase the number of antennas in a limited space as many as possible.
