Abstract (en)

[origin: WO2014187533A1] Disclosed is a container processing machine comprising a transport element (4), which can be driven peripherally, a plurality of processing positions (3), which are formed on the transport element (4) and to which the containers (2) to be processed are transferred by a transfer element (10, 10a) at a transfer position (12, 12a) and from which the processed containers (2) are removed by a transfer element (10, 10a) at a transfer position (12, 12a), wherein each processing position (3) has a processing head (5) and a container carrier (6, 6a), and wherein the processing head (5) and the container carrier (6, 6a) of each processing position (3) can be moved relative to each other by means of a lifting element (13) between a receiving and/or transfer state in order to receive a container (2) to be processed and/or in order to deposit a processed container (2) and a processing state.
