Abstract (en)

[origin: WO2014189872A1] A roofing bracket is configured to securely and removeably attach to a standing seam of a roofing panel. The roofing bracket has a first section and a plurality of second sections, each section having a base that defines a top and bottom face. A pressure clamping device extends between the first section and each of the plurality of second sections. A plank support system is selectively mountable onto the first section and configured to receive and retain a plank therein. The plank support system defines a plank support face and an angle lift mechanism configured to place a plank in a substantially horizontal position. A clamping adjustment mechanism is mounted onto each of the plurality of second sections and is configured to apply a torque to the first section and each of the second sections.
