Abstract (en)

[origin: EP2806432A1] The present invention relates to an insulation body (400) for providing electrical insulation of a conductor in an electrical device. The insulation body (400) comprises at least two modules (200[1] - 200[n]), each module having a hole through which the conductor (110) may extend. The at least two modules are arranged so that the holes of the at least two modules are aligned to form a passage for the conductor, and adjacent modules are arranged firmly against each other. Each module comprises at least one insulating material, and the relative permittivity of the insulation body varies in the axial and/or the radial direction of the insulation body.
