Abstract (en)
[origin: EP3002640A1] A wristwatch comprising an analog display of time and date; a micro-controller, whereby the micro-controller stores a set of indicator modes, whereby the set of indicator modes comprises at least a date mode and a first mode, and for each indicator mode at least a corresponding value; a date and information display part; and a selecting means being arranged to receive an actuation. the date and information display part comprises a display with date and indicator icons, enabled for an analog display of any one of the numbers between 1 and 31 and at least the indicator icon representative of the at least first mode; and a display with percentage values. The selecting means, when actuated, triggers the micro-controller to switch to a determined indicator mode taken from the set of indicator modes stored in the micro-controller, and is further configured to cause the display with date and indicator icons to display in analog mode the date or the indicator icon representative of the determined indicator mode, whereby if the determined indicator mode is the date mode then the display with date and indicator icons displays the corresponding value of the date, and if the determined indicator mode is the first mode, then display with date and indicator icons displays a corresponding icon of the first mode, and a second hand is pointed to a percentage value on the display with percentage values corresponding to the corresponding value stored for the first mode.
