Abstract (en)

[origin: WO2014195361A1] Container closure (1) for liquid containers (10), comprising a receiving region (2) for receiving a mouth section (10a) of the container (10), a fastening means (6) for locking the container closure (1) on the container, and a cover (8) for completely covering a mouth (32) of the container (10). A first opening can be made in said cover (8) when the container closure is locked on the container (10), via which opening a first fluid can be fed to or removed from the liquid container, said opening being at least partially located within the cross-section of the mouth of the liquid container (10). The container closure (1) comprises a predetermined opening section (12) lying outside the mouth of the container, by means of which predetermined opening section a fluid connection to the internal volume of a liquid container on which the container closure is locked can be established.
