Abstract (en)
[origin: WO2014191287A1] The present invention relates to a light device (1) comprising: at least one source (2) arranged to emit a light beam; an optical system (8) arranged to send each light beam from a central zone (9) in several possible directions (12) contained in a light plane (19) such that each light beam propagates in its light plane; an enclosed area (20), said enclosed area for example being equipped with an injector arranged to inject into the enclosed area suspended elements arranged to diffuse the light from each light beam; a reflector system (23) arranged to receive each light beam propagating in its light plane (19) and to reflect each received light beam in the enclosed area (20), said reflector system being arranged to move between several positions such that a change in position modifies the trajectory of a light beam reflected by the reflector system; and a control system arranged to move the reflector system (23) between its positions.
