Abstract (en)

[origin: WO2014191342A1] The invention proposes a control device (10) controlling an operating mode for an actuator of an electrical appliance, the control device (10) comprising a cylindrical drum (22) mounted rotatably relative to a wall (16) of the appliance, the control device (10) comprising first locking means (32) and second locking means (42) for the drum (22), characterized in that the drum (22) includes a plurality of axial notches (50) distributed regularly around the main axis of the drum (22), and in that an insert (52) is arranged in each notch (50), each insert (52) comprising a first segment able to cooperate with the first locking means (32), and a second segment able to cooperate or not cooperate with the second locking means (42).
