Abstract (en)

[origin: CN105514672A] A quick-connection system (200) comprising two connectors comprises: a first connector (100) having a body (102), a lever (104) rotatably mounted on the body (102) via a shaft (106), a recovering means (108) and a stick hook (110) mounted to one end of the lever (104) and having a first hooking means (116), and a second connector (300) having a body (302) and a second hooking means (304) provided for cooperating with the first hooking means (116). The first connector and the second connector are provided to be fitted into one another by approximation according to a connection direction (50) and the lever (104) is movable between a locking position wherein the first hooking means (116) cooperate with second hooking means (304) to prevent separation of the connectors by spacing parallel to the connection direction, and a free position in which the first attachment means does not cooperate with second fastening means thereby allowing the separation of connectors by moving parallel to the connection direction. The recovering means is provided to constrain the lever in the locking position and the first and second hooking means take the form of thread. Such an arrangement avoids including premature wear of the lever.
