Abstract (en)
[origin: WO2015002689A1] A disposable container for a cosmetics preparation or the like has a generally cylindrical body defining a reservoir for retaining the contents of the container, a base and a cap. The base has a bottom surface. At least one member extends radially from the bottom surface of the base. A layer of adhesive is provided on the bottom surface of the base, but not on the under surface of the radially extending member. A removable protective layer is situated over the adhesive layer. The protective layer has a radially extending portion aligned with the member radially extending from the base. The radially extending base member increases the stability of the container, facilitates removal of the cap from the container body and provides for easy removal of the protective sticker from the adhesive layer.
