Abstract (en)  
[origin: WO2014198258A1] The invention relates to a device (100) for neutralizing weapons by controlled detonation in the region of the bottom of a body of water (122), having at least one neutralizing charge accommodated in a cap-shaped holder. According to the invention, the holder (102) can be detachably connected to a base frame (10), and a detachable radio communication buoy (86) is assigned to the base frame (10) or to the holder (102), wherein the buoyancy force of the device (100) is always less than the weight force of the device (100) in order to ensure sufficient stability of the device (100) on the bottom of the body of water (122). The design of the base frame (10) according to the invention ensures high stability of the device (100), even with unfavorable flow conditions in the region of the bottom of the body of water (122). Owing to the fact that the ballast weight (94) can be introduced into the ground frame (10), preferably post hoc, the components to be handled, in particular the base frame (100), prior to use of the device (100) have a comparatively small mass.
