Abstract (en)  
[origin: WO2014198631A1] The invention relates to a texturing machine comprising a plurality of processing points that are distributed along opposing longitudinal machine sides in two machine halves that are arranged mirror-symmetrically. Each machine half comprises a winding frame for receiving a plurality of winding assemblies, a process frame for receiving a plurality of texturing assemblies, and a creel frame for receiving a plurality of feed spools, at least one operator path being associated with said texturing assemblies of the machine halves. According to the invention, in order to be able to operate the texturing assemblies of the two machine halves as rapidly as possible, the process frames for receiving said texturing assemblies are arranged to lie opposite one another at a distance from a mirror-symmetry plane, forming an operator path therebetween.
