Abstract (en)
[origin: WO2014198418A1] The invention relates to a switching operating arrangement (1), especially for a motor vehicle, comprising a movable control surface (2). The control surface (2) interacts with a sliding means (4) in such a way that the control surface (2) can be moved substantially linearly for at least one distance from a neutral position to a control position. The control position can be in the form of a switching position, such that in the switching position the control surface (2) has a switching effect on a switching element (7), a sensor or such like. The sliding means (4) comprises a rocking lever arrangement, which is movable especially in parallel.
