Abstract (en)
[origin: WO2014203223A1] The method comprises: a step, in which all the processing data are set; a step, in which the processing cycle is processed with one or more processing steps; a step, in which the processing cycle is controlled, which consists in controlling the rotation of a tube (2) around its longitudinal axis and the contact of the outer face of the tube (2) with at least one tool (18 and 31) along part or the entire longitudinal length of the tube (2), while performing a continuous or timed comparison of the result reached during the processing cycle; and a step in which the end of the processing cycle is signaled if the final configuration of the profiling (corrugation or deformation) of the tube 2 is detected.
