Abstract (en)
[origin: WO2014202254A1] The invention relates to a printing press (01) having at least one printing unit (04) which is configured as an inkjet system (06), wherein the relevant inkjet system is configured in such a way that said inkjet system prints an information item which changes or at least can change in a running printing process onto a target surface which is provided on a printing material, wherein there is at least one mark (14) on the printing material (07), wherein a detection device (16) is provided for detecting the at least one mark which is present on the printing material, wherein a printing position and/or a printing instant of the relevant inkjet system relative to a position of the target surface (08) which is provided for printing the information item which changes or at least can change in the running printing process is set or at least can be set using the at least one mark which is detected by the detection device in the running printing process, wherein the detection device which detects the at least one mark which is applied on the printing material is part of a cut register regulating device and/or a colour register regulating device. In addition, a method for printing an information item which changes or at least can change in a running printing process onto a target surface which is provided on a printing material is also described.
