Abstract (en)

[origin: WO2014202221A1] The invention relates to a resistor alloy (3) for an electrical resistor, in particular for a low-resistance current-measuring resistor, having a copper constituent, a manganese constituent and a nickel constituent. According to the invention, the manganese constituent has a mass fraction of 23% to 28%, while the nickel constituent has a mass fraction of 9% to 13%. The mass fractions of the alloy constituents are adjusted to one another in such a manner that, compared to copper, the resistor alloy (3) has a low thermal electromotive force at 20° C of less than  $\pm 1 \mu\text{V/K}$ . The invention furthermore comprises a component made from such a resistor alloy and a production method therefor.
