Abstract (en)
[origin: WO2014202151A1] Apparatuses and methods are provided, by which identities of virtualized network entities which are realized as virtual machines or as entities running on virtual machines in a virtualized network, and identities of physical entities on which the virtualized network entities are carried out, are stored in a memory, and an identity of at least one virtualized network entity is selected based on an identity of the physical entity on which the at least one virtualized network entity is carried out. For example, when a request for selecting a virtualized network entity is received, a virtualized network entity is selected which is carried out on the same physical entity as the requesting entity.
