Abstract (en)

[origin: CA2910308A1] The presented and described invention relates to a means to arrange an edge protection means on a package, with at least one drive wheel with which the means is movable along a running rail from a point of departure to the package and from the package to the point of departure, with a motor carried by the means itself and which sets at least one drive wheel in motion, with a clamp mounting comprising a movable clamping jar and a counter bearing to take up the edge protection means in an open position of the clamping jaw and hold it in a closed position of the clamping jaw, whereby the motor to drive the at least one drive wheel acts upon at least one power transmission means which induces the opening and closing movement of the clamping jaw.
