Abstract (en)
[origin: WO2014206982A1] The aerial lift according to the invention comprises a chassis equipped with means for moving over the ground surface, a mast, a platform (10) supported by the mast, a control console mounted on the platform and comprising means for controlling movements of the platform, and a safety bar mounted so as to tilt or slide relative to the console, designed to control the operation of the control means. This safety bar is intended to assume a first, idle position where the safety bar does not prevent the operation of the control means, and a second position, wherein the safety bar inhibits the operation of the control means. When it tilts or slides between the first position and the second position, the safety bar assumes an intermediate position where it does not prevent the operation of the control means and wherein it activates warning means.
