Abstract (en)  
[origin: WO2014207252A1] The invention relates to a system for producing a door frame comprising a threshold (1) having an, if appropriate, multi-part threshold basic body (2), a cover (6) and also a swirl channel (9) formed as an undercut, an outer frame profile (11) with an outer frame back (14) having latching webs (8), and an, if appropriate, multi-part threshold holder (17). In order to allow efficient assembly, it is proposed that the threshold holder (17) has a basic body (20) and a fastening plate (21) oriented perpendicularly to the basic body (20), wherein the basic body (20) of the threshold holder (17) is designed and can be fastened to the threshold basic body (2) in such a way that, with its outer contour facing away from the fastening plate (21), it at least substantially continues the outer contour of the cover (6), placed on the threshold basic body (2), in the direction of extent of the threshold (1) and, with its outer contour facing the fastening plate (21), terminates at least substantially flush with the threshold (1). With the outer frame profile (11) placed, the fastening plate (21) bears between two latching webs (8) against the outer frame back (14) such that the outer frame profile (11) terminates with latching webs (15) of the outer frame back (14) at least substantially flush with the threshold (1).
