Abstract (en)  
[origin: CA2910638A1] A piece of snow sports equipment comprises a sliding board with a sheetlike central part which extends in a longitudinal direction, and two sheetlike side parts which are fastened to the central part on both sides. The central part has a sliding coating on a lower side. The side parts can be folded over from a first position, in which a first main surface of the side parts is substantially co-planar with the lower side of the central part, into a second position, in which the side parts are folded under the central part such that the first main surfaces of the side parts are supported on the lower side of the central part. Second main surfaces of the side parts, which second main surfaces lie opposite the first main surfaces, have a climbing skin.
