Abstract (en)

[origin: WO2015003769A1] A chassis suspension arm (1) for a vehicle, having an elongate suspension arm body (2) consisting of a single-piece metal plate which is deformed by bending in such a manner that said suspension arm body forms two side walls (3) which are opposite each other at a distance, wherein the side walls (3) are connected to each other at least in sections on the free longitudinal sides (4) thereof by a joining connection (5), and the axial ends of said suspension arm body each have at least two bearing openings (6) arranged coaxially with respect to each other, and at least one rubber/metal bearing (7) which is insertable into the coaxial bearing openings (6), wherein the cardanic rigidity of at least one of the rubber/metal bearings (7) is lower than the torsional rigidity of the suspension arm body (2).
