Abstract (en)

[origin: WO2015006878A1] The fire-resistant component comprises at least one fire-resistant glass, for example in the form of a fire-resistant pane or a composite fire-resistant pane and a frame. The fire-resistant glass is held in a mounting on the frame so as to leave a rebate clearance space at the edge of the fire-resistant glass. A foamable seal is placed on the edge of the fire-resistant glass so that a foaming operation at least partially seals a passage through the rebate clearance space. The fire-resistant glass is fixed in the mounting by means of an adhesive.
