Abstract (en)  
[origin: EP3023047A1] A steam cleaning device comprises a housing; a boiler mounted in the housing; and a floor head in fluid communication with the boiler and coupled to the housing. The housing comprises at least one first air hole and at least one second air hole and an air flow path therebetween. The at least one first and at least one second air holes are positioned either side of the boiler along a longitudinal axis of the steam cleaning device and the at least one first and at least one second air holes are positioned either side of the boiler along a transverse axis of the steam cleaning device. One of the at least one first or second air holes is above the other of the at least one first or second air holes when the steam cleaning device is in a substantially vertical position or a substantially horizontal position.
