Abstract (en)

[origin: WO2015011379A1] A system (1) for holding a stick in a casing comprising an inner cup (3) provided with a plurality of at least partially flexible claws (10) that can assume two positions: – an open position, in which the claws (10) allow the stick to be inserted into the inner cup (3); – a blocked position in which the claws (10) can penetrate into the stick previously inserted into the inner cup (3) in order to block it; the system (1) being characterised in that it further comprises an outer cup (4) of which the dimensions are designed to allow the claws (10) to shift from the open position to the closed position, and in that it comprises means (20) for locking the inner cup (3) in the outer cup (4) when the claws (10) are in the blocked position.
