Abstract (en)  
[origin: WO2015011427A1] The invention relates to a system for dispensing a liquid, which includes: an apparatus (A) comprising a device (14) for pumping and dispensing the pumped liquid and two hollow needles (50, 52) in communication with the device; a liquid vessel (R) which is capable of being inserted into the apparatus such as to be pierced by the needles in order to suction the liquid while allowing the return of air, and also of being removed from the apparatus. The vessel is capable per se of delivering all the contained liquid by pumping the device (14). The needles each form a communication interface between said pumping and dispensing device and the vessel along separate liquid and air fluid circuits.
