Abstract (en)
[origin: WO2015014374A1] The invention relates to a shoe (1), which has a shoe upper (2) and a sole (3) connected to the shoe upper (2), wherein the shoe upper (2) has, in its instep region (4), two tightening portions (5) arranged adjacent to each other and separated by a gap, wherein a lacing system (6, 7) is present with which the shoe (1) can be laced up on the foot of the person wearing the shoe (1), by means of the adjacently arranged tightening portions (5) being pulled towards each other, wherein the lacing system (6, 7) comprises a central fastener (6), with which a first tightening element (7) can be tightened. In order to achieve a simple and at the same time improved tightening of the shoe on the foot of the wearer, the invention proposes that at least one tension-transmitting element (8) is present which comprises a first tensioning part (9) and a second tensioning part (10), wherein the first tightening element (7) engages in the first tensioning part (9) and pulls the latter in the direction of the instep (4) when the first tightening element (7) is tightened, wherein a second tightening element (11) is present which is secured with its two ends (12, 13) on the sole (3), wherein the second tightening element (11) engages in the second tensioning part (10) and pulls the latter in the direction of the sole (2) when the first tightening element (7) is tightened, wherein the first tensioning part (9) and the second tensioning part (10) are connected to each other via a tensioning element (14).
