Abstract (en)
[origin: WO2015015227A1] A fire suppression system includes: first and second fluid distribution devices; first and second fluid flow paths for connecting the respective first and second fluid distribution devices to a fluid source; first and second non-return valves positioned in the respective first and second fluid flow paths; first and second pressure sensing devices positioned in the respective first and second fluid flow paths for sensing the pressure of fluid in the first and second fluid flow paths at respective first and second locations and for generating signals indicative of the sensed pressure at the first and second locations; and a controller for receiving the respective signals from the first and second pressure sensing devices and for providing an indication to a user as to the location or likely location of a potential fluid leak in the first or second fluid flow paths.
