Abstract (en)

[origin: WO2015014798A1] The invention relates to a device for transporting separating elements and inserting separating elements into containers, which containers are each formed by a plurality of receptacles, wherein adjacent receptacles are separated from each other at least in some areas by means of the separating elements to be inserted, and wherein a transport device removes the separating element from a magazine and transports the separating element to an insertion station, by means of which the respective separating element is inserted into the container. It is proposed that at least the transport device is designed as a linear transporter having a closed motion path, on which motion elements circulate in a common direction, wherein at least one gripping element is arranged on each motion element.
