Abstract (en)

[origin: WO2015018789A1] The invention relates to a clamping claw (108) for a tensioning device (100) for clamping a workpiece (102) on a clamping surface (104), wherein the clamping claw (108) comprises a basic body (116) and a clamping piece (184), which relative to the basic body (116) is slidably held on the basic body, which can be utilized in a more flexible way, wherein in particular in the clamped state of the workpiece (102), the clamping surface of the workpiece and the support surface (112) of the clamping support (114) can be on different height levels, and/or the clamping direction with the longitudinal direction (120) of the clamping claw (108) can form an angle that is different from 90°. According to the invention the clamping claw comprises a guide device (209), by means of which the clamping piece (184) can be displaced relative to the basic body (116) along an at least sectionally curved displacement path (210).
