Abstract (en)  
[origin: WO2015017878A1] A device (100) for bearing load to separate in a direction of separation an element from another element. The device includes two or more members (120, 121, 122) and one or more separating portions (113, 114). Each of the two or more members is mounted to slide along at least one respective slide path portion. Each of the one or more separating portions separates a respective two of the members. The slide path portions and the one or more separating portions are arranged such that relative movement of one of the members towards one of the elements moves at least one of the one or more separating portions to cause at least one other of the members to relatively move away from the one of the elements, and to accommodate misalignment of the elements whilst sharing the load between the members.
