Abstract (en)

A mechanism for a timepiece, comprising a an oscillating regulator mechanism (7), a rotary energy distribution toothed wheel (5), a blocking mechanism (6) controlled by the regulator mechanism to alternatively hold and release the energy distribution wheel, and a monostable elastic member (9) linked to the regulator mechanism and bearing on the teeth of the energy distribution wheel. The teeth of the energy distribution wheel are adapted to elastically deform the monostable elastic member by cam effect during rotation of the wheel, and the monostable elastic member is adapted to elastically return to its rest position, thus releasing mechanical energy to the regulator mechanism.
