Abstract (en)

Known security systems issue an audible and/or visible alarm to alert all those local to a secured article that the article has been compromised. However, for various reasons, passers-by do not respond to such an alarm/alert. According to the present invention, if an intruder interferes with a secured article 100, a sensor 70 may detect an event associated with an article 100 being interfered with and/or compromised. This detection will trigger (via a processor 80) an alarm condition, and a transceiver 90 will send 20 an alarm signal to a monitoring device 10 over a communication network 50; however, no indication of the alarm condition is detectable outside the housing 40 by means other than via the alarm signal 20. In this way, an intruder compromising an article 100 is not alerted to detection of the event by the sensor 70. Therefore, authorities may be summoned to apprehend the intruder without the intruder being provided with the opportunity to escape.
