Abstract (en)

[origin: WO2015024137A1] The invention relates to a lying system (1), comprising at least one leveling chamber (4) that can be filled with air. The lying system (1) contains a lying side (2), which forms a lying surface, and a support side (3). The at least one leveling chamber (4) that can be filled with air is part of a leveling device (4) or forms part of a leveling device and can be filled with air in such a way that the lying system (1) has locally different heights outside of the usage position. Thus, the support side (3) can be at least partially adapted to the inclination and/or the unevenness of the ground, such that the lying surface is more even and/or less inclined than the ground in the usage position.
