Abstract (en)
[origin: WO2015025044A1] The invention relates to a foam gun, in particular for polyurethane foam, having a body and a handle, which is arranged on the body and has a triggering device, having a container holder and having a fluid connection between the container holder and an outlet opening, wherein an interchangeable dispensing tip can be fastened on the outlet opening. In order to make it easier for the dispensing tips to be carried along, the invention proposes for the handle to be designed for accommodating at least one dispensing tip. The handle may be of internally hollow design and serve for storing at least one dispensing tip, preferably a plurality of dispensing tips. This is advantageous to the extent that the foam gun has replacement dispensing tips in each case and these do not have to be carried along separately. In addition, up until they are used, the dispensing tips are protected against the often rough basic conditions at the use location of the foam gun, in particular also against contamination with chemicals, which could bring about an undesired reaction with the exiting polyurethane foam.
