Abstract (en)
[origin: WO2015024987A1] The invention relates to a first carrier element (1) for a screw clamp (2) having a first element (3) which has a substantially circular cross section and two free ends (3a, 3b). Furthermore, it has a holder element (4) which is arranged on one of the two free ends (3a, 3b) of the first element (3), and a substantially annular receiving element (5) which is rotatably arranged on the holder element (4) and which is suitable for receiving a fastening means (6). A longitudinal axis L3 of the first element (3) and a longitudinal axis L5 of the receiving element (5) can intersect at a point of intersection S of which the position is independent of a rotary position of the receiving element (5). The receiving element (5) can be rotatable about an axis of rotation which is perpendicular to the longitudinal axis L3 of the first element (3) and the longitudinal axis L5 of the receiving element (5).
