Abstract (en)

[origin: WO2015028525A1] Device (1) for emptying containers (10) with a first holding device (2) which is suitable for holding a first region (10a) of a container (10) to be emptied, with a second holding device (4) which is suitable for holding a second region (10b) of the container (10) to be emptied, wherein the second region (10b) is spaced apart from the first region (10a), with a movement device (20) which is suitable for moving the first holding device (2) towards the second holding device (4), in order to compress the container (10) which is situated between the first holding device (2) and the second holding device (4), and with a removal device (40) which has a flow connection to the interior of the container (10) and via which liquid which is situated in the container (10) can be removed as a consequence of a compression of the container (10), with a drive device (8) for driving the movement device and with a control device (6) which controls the relative movement of one holding device (4) with respect to the other holding device (2) depending on an internal pressure within the container. According to the invention, the control device (6) is designed in such a way that it controls the relative movement of one holding device (4) with respect to the other holding device depending on a drive torque of the drive device (8).
