Abstract (en)

[origin: EP3041270A1] The present invention relates to a method of superimposing spatial auditory cues to an externally picked-up sound signal ($s_E(t)$) in a hearing instrument (107, 109). The method comprises steps of generating an external microphone signal ($s_E(t)$) by an external microphone arrangement (105) and transmitting the external microphone signal ($s_E(t)$) to a wireless receiver of a first hearing instrument (107) via a first wireless communication link (104). Further steps of the methodology comprise determining response characteristics of a first spatial synthesis filter ($g_L(t)$) by correlating the external microphone signal ($s_E(t)$) and a first hearing aid microphone signal ($s_L(t)$) of the first hearing instrument (107) and filtering the external microphone signal ($s_E(t)$) by the first spatial synthesis filter ($g_L(t)$) to produce a first synthesized microphone signal ($y_L(t)$) comprising first spatial auditory cues.
