Abstract (en)  
[origin: WO2015032684A1] A fitting for a sliding door (60) comprises a rail (3) along which at least one running part (4) is displaceably mounted, and an automatic retractor (5) with a driver (7) which can be displaced along a guide path and which can be coupled to an activator (8, 10) arranged on the running part (4) in order to move the running part (4) into an end position, wherein the activator (8, 10) can be moved relative to a carrier (40) of the running part (4) from a mounting position into at least one functional position in which coupling with the driver (7) of the automatic retractor can take place, and the activator (8, 10) allows mounting of the running part (4) on the rail (3) in the mounting position but, in a functional position, the running part (4) is secured by a stop (15, 85) on the activator (8, 10) against being lifted out from the rail (3). As a result, simple mounting of the fitting with the automatic retractor can be achieved.
