Abstract (en)
[origin: WO2015007719A1] An arrangement for emitting light (1) is designed to be secured on a support element, for example a room ceiling (102), which extends on a first plane, and to illuminate a surface (110), which extends on a second plane that extends substantially perpendicularly to the first plane. The arrangement has a light source (10) which emits light in a direction facing away from the surface (110) to be illuminated and a reflector (20) which is arranged and designed such that the incident light beams from the light source (10) are substantially reflected in a uniformly distributed manner towards the surface (110) to be illuminated.
