Abstract (en)
[origin: WO2015041892A1] A user device may be configured to detect a user-uttered trigger expression and to respond by interpreting subsequent words or phrases as commands. The commands may be recognized by sending audio containing the words or phrases to a remote service that is configured to perform speech recognition. Certain commands may be designated as local commands and may be detected locally rather than relying on the remote service. Upon detection of the trigger expression, audio is streamed to the remote service and also analyzed locally to detect utterances of local commands. Upon detecting a local command, a corresponding function is immediately initiated, and subsequent activities or responses by the remote service are canceled or ignored.
