Abstract (en)

[origin: CA2924484A1] The present invention relates to a device for reorientation of eggs deposited in the hollow open cells (3) of a tray, said device being intended to reorientate at least one egg (2) from said tray along a substantially vertical axis. According to the invention, the device comprises at least one reorientation element (1) capable of moving between a low position and a high position with respect to the cell containing the egg to be reorientated, said reorientation element comprising a lower seat (10) on which the upright rods (11) are fixed, the upper ends of said rods being able to spread out with respect to each other on contact with the egg to be re-orientated, the upright rods being intended to interpose themselves between the cell and the egg, in the high position, so as to damp and guide a movement of the egg under the effect of its weight to a substantially vertical position.
