Abstract (en)

[origin: WO2015043968A1] The invention relates to a method for producing a connection element, in particular for steel structures of towers, preferably for wind turbines and to a connection element or node element, wherein a flange (12) and a shell (14) integrally adjoining the flange (12) is produced from a blank (40) by means of a flow forming process, and then the end of the shell (14) opposite the flange (12) is adapted to the contour of the component to which the shell (14) is to be connected. The invention further relates to a connection and node element.
