Abstract (en)
[origin: WO2015090979A1] The invention relates to a rail vehicle, in particular locomotive, comprising at least one chassis with a chassis frame (10) supported resiliently on sets of wheels, and a superstructure, which is supported resiliently on the at least one chassis and is mounted rotatably about a vertical axis, with a bogie (13). According to the invention, a removal device (1) for removing snow (S) and/or ice (E) is arranged between the bogie (13) and the chassis frame (10), the removal device having an inclined sliding surface (3) which at least partially covers the chassis frame (10). Deposits of snow (S) and/or ice (E) both on the chassis frame (10) and on the bogie (13) of the superstructure can thereby be prevented or eliminated.
