Abstract (en)

[origin: WO2015124969A1] A postal packet is provided with multiple functions in so far as it is made up of multiple compartments set on top of one another that enable, through purposely provided anti-effraction tear-open closing systems, two-dimensional and/or three-dimensional objects to be contained in the various housing levels. The anti-effraction system is characterized by a separation of the various housings present within each compartment that does not enable objects inserted therein to be taken out unless in the case where the addressee opens it by tearing open the individual leaves. Furthermore, the postal packet, which may have various shapes, owing to its particular conformation and given the possibility of using individually each element thereof, enables creation of advertising coupons, visiting cards, or any product of visual communication.
