Abstract (en)

[origin: WO2015039745A2] The invention relates to a rotor (1) for a camshaft adjuster for rotation about a rotation axis. The rotor has an inner sheath (3) and an outer sheath (4) and at least one control vane (5), pointing at least substantially radially away from the rotation axis, having a first control vane side (5) and a second control vane side. The rotor furthermore has a first liquid channel system (6) and a second liquid channel system, wherein the first liquid channel system opens in a first liquid channel opening (8) and the second liquid channel system opens in a second liquid channel opening (10). The rotor (1) comprises: a first sintered joining part (12), a second sintered joining part (13) which is joined to the first sintered joining part (12) and an insert part (14) which is inserted in an intermediate chamber which is formed by at least one of a first recess of the first sintered joining part (12) and a second recess of the second sintered joining part (13). The invention further relates to a parts set and to a method for producing a joined component.
