Abstract (en)
In a resealable label flap, a flap portion (11) serves as a cover for an opening in a package (30) and comprises a base layer (32) extending between two ends (33, 35). An adhesive (31) on a bottom surface of the base layer (32) permits repeated application and separation of the base layer (32) relative to the package. A top layer (38) attached to a portion of a top surface of the base layer (32) extends between the second end (35) and a hinge portion (34) of the base layer (32). A portion of the base layer carrying the top layer can pivot away from the package (30) at the hinge portion (34) into an open position. The top layer then acts as a counter balance to allow the flap portion to remain in the open position.
