Abstract (en)

[origin: WO2015049104A1] The present invention relates to a bearing block (1) for articulating a coupling rod to a carriage body of a track-guided vehicle, in particular a rail vehicle. In order to be able to adapt the bearing block (1) for different applications in a manner which can be achieved simply but yet effectively, a modular construction is provided. For this purpose, the bearing block (1) has a first transverse part (7.1) with a bearing shell (3.1) lying in a first horizontal plane and a second transverse part (7.2) with a bearing shell (3.2) lying in a second horizontal plane. The two bearing shells (3.1, 3.2) in each case have a receptacle (4.1, 4.2) for a vertically extending (common) pivot bolt or for a pivot pin (54.1, 54.2) assigned to the corresponding bearing shell (3.1, 3.2). The modular construction of the bearing block (1) is particularly achieved in that the first and second transverse parts (7.1, 7.2) are designed as separate components which can be connected independently of one another in the carriage body of the track-guided vehicle.
